

Marketing Release Note

LightSYS+ Plug-In PSTN Module

RISCO is pleased to announce the release of the LightSYS+ Plug-In PSTN Module.

The PSTN module has multiple uses:

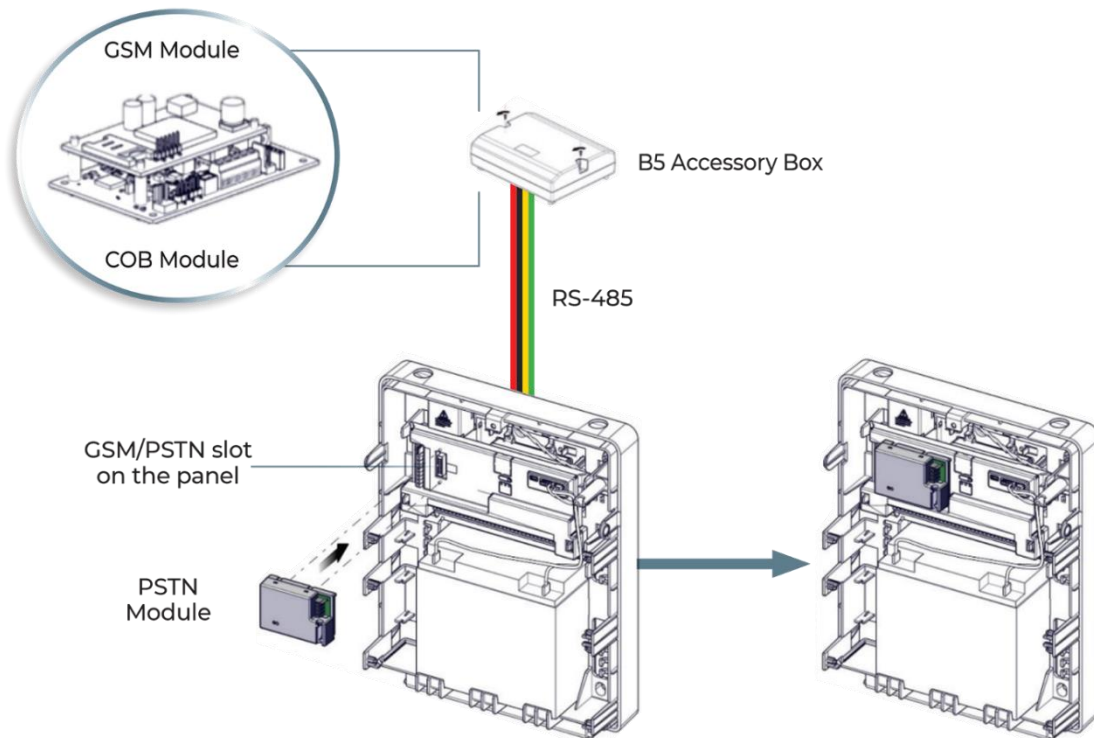

1. The plug-in PSTN module enables the panel to communicate with a monitoring station (CMS) using common format protocols (**SIA, Contact ID**).
2. For configuring a Voice 'Follow Me' over the PSTN with predefined recorded voice messages, and if there is no voice module in the control panel, it's also possible to set voice 'Follow Me' over PSTN but it is limited for alarms - in case of an alarm the user receives a call, and as soon as he answers the call, he hears beeps – these beeps are an indication of an alarm
3. When a voice module is installed, the PSTN module also supports incoming calls, including some remote operations through DTMF such as Arming and Disarming the system.
4. The PSTN module can function as a primary communication channel to CMS and/or 'Follow Me', or as a backup communication in case of cloud failure.

** Using the Configuration Software (CS) via PSTN communication is not supported.

The PSTN module should be plugged into the GSM/PSTN module slot on the LightSYS+ panel.

In installations that require both PSTN and GSM modules, the GSM module should be installed on the COB (Cellular on Bus). In this case the voice will be supported only on the PSTN.

LightSYS+ Firmware support

The PSTN module is supported by FW version 2.1.0.004 and up.
